The eno–divIC–Rv1025–ppx2 block is retained across the Actinobacteria phylum
eno–divIC–Rv1025–ppx2 operon
Rv1025 a.a. identity to H37Rv shown per tip (gene order normalised left→right)
Actinobacteria (Actinomycetota)
Corynebacteriales
M. tuberculosis (Rv1025)
M. avium
M. abscessus
M. leprae (reductive)
Rhodococcus jostii
Nocardia farcinica
Tsukamurella paurometabola
Gordonia bronchialis
Corynebacterium glutamicum
Corynebacterium diphtheriae
Streptomyces coelicolor
Cutibacterium acnes
Micrococcus luteus
Bifidobacterium longum
Escherichia coli (out-group)
Bacillus subtilis (out-group)
